

All bugs checked on both Google Chrome (Version 54.0.2840.99 m) and MicroSoft Edge (25.10586.0.0).

Red text – issue verified to still be open

Green text – issue verified to be closed

Blue Text – issue has changed from when originally written up, but is still not fixed

Front Page (pre-login)

- “Contact Us” link on front page doesn’t seem to work, just brings user to top of page instead of directing them to sending an e-mail [Dwayne: this is a browser/os/user configuration issue and is ever-changing. Just google ‘chrome mailto links not working’ and you’ll see. In a browser that it does not work on, you’ll see that the common right click menu will give a ‘copy email address’ command which is how you would normally send an email from a browser page without any specific behavior defined. We can change it to a form-based, fill in the blanks and hit send approach, but there are problems with this too, namely: a) potential for someone to use an invalid/incorrect email address, and thus not be able to contact them, and b) no ability for the sender to cc other people or use attachments, web links, etc.]
- When trying to sign up with Facebook – “App Not Setup: This app is still in development mode, and you don't have access to it. Switch to a registered test user or ask an app admin for permissions.”
 - o Pressing “Okay” from this page doesn’t work and leaves user stuck on page.
 - o Same error was given when pressing the “Link account to Facebook” link once already signed in to GoalPost

[Dwayne: the facebook feature won’t work until we launch and remove the 8080. Facebook won’t let me have both, and they will also require an approval process once we launch on goalpostpro.com, so there may be a delay before soft launch and the ability to verify that this feature is working. Since I am the developer, and registered on facebook to accept the facebook login when its me, I’ve tested it as much as I can. We will have to soft launch, then apply for facebook approval, and then verify that it is working. This will be a one time process for our goalpostpro.com url]

Main Page (logged in)

- Cursor does not change to hand when hovering over the Like feature, as it does when hovering over the Photo or Comment features. Users may be confused or unaware how to actually like something since it is not obvious that they can click the thumbs up icon. – The cursor will change into the proper icon when hovering over a Like button, but only when there has been no Likes for that post. If there is at least one Like, then the hand icon will not appear when hovering over the Like button. [Dwayne: very minor issues IMHO. Actually, there are dozens of these kinds of things that need cleanup. They should not prevent us from launching]

- Once the user has Liked something and the page is refreshed or re-visited, they are able to like the same item again another time. However, if the page is refreshed or re-visited again, this new Like will not appear. May cause confusion as it will sometimes appear the user's Likes are not being registered. [Dwayne: minor issue. There was another mention of this (Ryan or AJ?) where you could 'Like' it as many times as you want, but when you refresh the page it went back to only one like by you. This is how I designed it because it was quick and easy. It actually is a bit of a fun feature, because you think you can add a bunch of likes (having fun) but then find out that you cant. There are a lot more features that need to be added to the like button. But they require a lot more development. For example, when you hover over it, you can see a list of who has liked it. I appreciate that these kinds of things are noted, but I don't believe that we should hold off on launch until this feature is more robust. Those are enhancements we can make over time. Most features, in fact, can be made more robust over time.]
- There doesn't seem to be a way to edit or delete comments or pictures I've posted to other's goals. This can become an issue when users accidentally upload the wrong image, or more commonly, when errors or typos are made in comments that need to be edited. [Dwayne: feature enhancement. There's a lot more we can do too for comments and upload photos, but it's much more development. Like I said in the previous item, we should launch with what we have, and make these areas more robust over time.]
- The FaceBook icon in the top right corner of the screen is missing while on the latest version of Microsoft Edge (Windows 10 default browser), although it can still be clicked. The icon appears normally while using the latest Google Chrome. [Dwayne: I can't reproduce this. I have Microsoft Edge 38.14393.0.0. Can I get a screen shot? Maybe it is a problem with the way I grey out the icon if you're not logged into facebook. Also, see my comments above about Facebook]

My Goals

- My Goals: Users can currently earn as many points as they want when visiting the My Goals tab when they have no Goals yet made. Clicking the My Goals tab will display the "You've earned another point!" message. If the user closes this, and reselects the My Goals tab, the same message will be displayed. Although the displayed point total will not change, the user is actually earning a point every time they do this. Once a Goal is actually made and the My Goals tab is visited again, the proper point total will be displayed. I was able to generate 40 points on one account by clicking the My Goals tab repeatedly. I realized this also means that no points will be generated if the user has at least one active Goal, even after waiting 24 hours to visit.[Dwayne: this should be much improved in the latest update (12/9). You should no longer be able to get points when you have no goals. I know there are more areas of improvement to be done here, but I don't think it should prevent launch. I would like to revisit points in general after launch and figure out what we do with points anyway]
- My Goals – Different icons appear when you get your daily bonus, like a dollar bill, soccer ball, etc. Are the different images supposed to have meaning, different amounts of points earned or anything? Currently this is unclear. – It looks like the "G" icon will appear every time now, however random icons will still sometimes appear next to that with no clear meaning.

- My Goals – The “Congratulations, you earned another point! You have 0 Goal Points” message will always display a zero for the user’s current total, regardless of how many points they actually have.[Dwayne: please revisit this again with a new user account. I think it’s been fixed]
- My Goals – The text “A Facebook post will also be made.” appears when posting a Goal, despite the user not being signed in or linked to a FaceBook account. – This text only appears on Google Chrome. It did not appear on ME.[Dwayne: I need to revisit this after we launch and get rid of the 8080.]
- My Goals: The My Goals icon (target with green arrow pointing towards center) appears next to many Goals. However, there is no text that appears when hovering over this icon, and currently it is unclear what this icon is supposed to signify. I thought it was to signify accomplished Goals, but I am seeing it next to active and inactive goals.

Organizations

- Organizations – List Existing Schools: Selecting any school from this list will add it to the user’s list of organizations they belong to, but this is not clear when going through the list. No notifications, check marks or anything else appear when clicking a school in the list. I accidentally added myself to a bunch of organizations when navigating the list.
- Become An Owner – The link for the 619-354-4900 phone number does not work when clicked.[Dwayne: This is a browser/os/user settings issue. This is called an HTML tel link. A tel link works only when you have something that can call a phone number, like a mobile phone or skype installed on a desktop computer. It’s working as it is intended. See my similar comments for the email links]
- Organizations – School Map: The “Find Me” button does not seem to do anything when selected.[Dwayne: I’ve removed this for now. See my comments for ‘Geolocation service failed’ below]
- Organizations I Belong To: The “See People at This Organization” button will only show people in that Organization that are already on the user’s friend list. Unsure if this is intentional. User is brought to the My Friends Filtered page when clicking the button.[Dwayne: I’ve removed all of the filtering for now. Originally, with the old site, this was a way to filter down from Organization through groups to people. It never actually worked that well as I had designed it (not only functionally but visually too). I really need to redesign this whole area into something else, or just not do it. The reason is because we are leaning more towards a facebook like approach, most people just want to see their friends list, no matter how they became friends. It’s a big feature and needs more time, but we can launch since most people for the first few months anyway will not acquire enough friends to have to filter them out. Plus, the fact that I added group and organization info to the lists (e.g. people shows their groups, groups shows their orgs) this may not be needed at all.]
- Organizations: I’m getting a “Error: Geolocation service failed.” error when trying to use the GPS feature of the map on the latest version of Google Chrome (Version 54.0.2840.99 m). I reset my settings to default and made sure to allow location through Chrome, but I still get this error, although the GPS works fine on other sites like Google Maps. I did not encounter this error on the latest version of ME.[Dwayne: Google is changing the way they allow

geolocation info to be captured by the browser. Specifically, they now require HTTPS (secure) requests. They changed this early summer, and it is expected that other browsers will follow. This was because of a security risk in a hacker finding out where you are by looking at the geolocation data going from your browser to the server. This requires what is called a man-in-the-middle attack, which is rare. I was able to trap this as an error, and display a more friendly message. To fix this right, we will need to add HTTPS to our server, which requires a bit of coding but also a Verisign type signed certificate for the server, which is matched to the URL, which now will be goalpostpro.com....This is another thing that can be done after we launch.]

Groups

- Groups: Selecting the “See the people for this group” button currently does not function properly. Selecting it will display the username “@@teamname” multiple times with a Clear Filter (show all) link. Clicking the link will delete that instance of @@teamname, and have no other function.[Dwayne: feature removed for now as described previously]
- Groups: The “Message the coaches” feature does not seem to function properly. The site will let you write a message, but the message “No valid recipients” will appear when trying to send it. – Still is happening on ME. On Google Chrome, the Recipients field will be completely blank when selecting to send a message. [Dwayne: Didn’t know this was still a bug, will fix before Monday.]

Friends

Messages

- Messages – My Inbox: There is no way to reply to messages in the inbox. The only option that appears for mail is Archive.[Dwayne: will investigate before Monday]

Settings

- Settings – Profile Information: Users are given the option to change their e-mail address, however any changes made to the e-mail field will not save. Any changes made are undone when refreshing the page or revisiting it.[Dwayne: I’ve changed this (12/9) so that the email address is not editable. There are many things that will be affected by an email change and we aren’t there yet, so save this for a future date]
- Settings – Profile Picture: It may not be clear what file types or sizes are supported. Selecting an unsupported file type does not properly notify the user. It will either display the “File is

Uploading...” message indefinitely, or it will display the message for a brief time before disappearing. These issues also appear when uploading photos to user’s Goals. – [Issue no longer occurs when uploading Profile Picture. Issue still occurs when uploading unsupported file types \(.GIF, .BMP\) to Goals though.](#)

- Settings – Goal Photos: This section doesn’t seem to work at all. Photos that other people post to your Goal will upload automatically and will not appear in this section. Photos that you post yourself also do not show up in this section. – [This section still seems to be working inconsistently. Some photos are now appearing in this section, but it still seems that my pictures will automatically upload to Goals when I post them. I will need to test this more with fresh accounts.](#)[Dwayne: I don’t know what ‘doesn’t seem to work at all’ means. One thing that may be causing confusion when doing testing (as opposed to real world users) is that all photos go through an approval process. It should be working like this: When you upload a photo of any kind, YOU will see it in your browser, but no one else will see it until it’s approved by an admin. If you upload a photo to someone else’s goal post, THEN admin has to approve it (as before), and only AFTER admin approves it then you will receive an email and be able to approve it for public viewing on your goal post. AFAIK, it is working this way. If you are testing with two different accounts at the same time, it would appear to be broken, but is not.]
- **Settings - Profile Picture: When cropping a photo, I feel that the “Save Thumb” button is in an awkward place, and multiple times I have found myself unable to find it for a few moments before realizing it is inside the image itself.** [Dwayne: I debated where to put the button. I first had it outside to the left of the thumb, and also to the top. But it could be shoved off the screen depending on what device you are using and where you are positionin the thumb. So inside was the safe bet for now]

Help

- **Help: The two links for the 760-295-0072 number and the askus@goalpostsolutions.com address to not do anything when clicked on the latest version of Google Chrome (Version 54.0.2840.99 m).** On IE, the phone number link will open a blank Google Chrome page when clicked, but the e-mail address link worked properly when clicked and prompted me to send an e-mail.
- **Help: The Help sections mentions that when a photo is uploaded to your post, you should receive an e-mail linking you to your settings so you can approve it. Currently this does not take place when uploading photos to other people’s Goals.**[Dwayne: see my comments about ‘Goal Photos’ above. I think that explains what is happening. I modified the help text to make it more clear (not live yet)]
